

CLAIMS**WHAT IS CLAIMED IS:**

- 5 1. A method comprising:
 - determining that blob data in a source field is associated with a first coded character set identifier;
 - determining a second coded character set identifier for a target field; and
 - replicating the blob data from the source field to the target field based on the first
 - 10 coded character set identifier and the second coded character set identifier.
2. The method of claim 1, wherein the target field has an associated type of character.
3. The method of claim 1, wherein the first coded character set identifier specifies a
- 15 character set, a code page, and an encoding scheme.
4. The method of claim 3, wherein the character set is DBCS.
5. The method of claim 1, wherein the second coded character set identifier specifies a
- 20 character set, a code page, and an encoding scheme.
6. The method of claim 6, wherein, wherein the encoding scheme is UTF-8.
7. A signal-bearing medium encoded with instructions, wherein the instructions when
- 25 executed by a processor comprise:
 - determining that blob data in a source field is associated with a first coded character set identifier;
 - determining a second coded character set identifier for a target field, wherein the target field has an associated type of character; and
 - 30 replicating the blob data from the source field to the target field based on the first coded character set identifier and the second coded character set identifier.

8. The signal-bearing medium of claim 7, wherein the first coded character set identifier specifies a character set, a code page, and an encoding scheme.
- 5 9. The signal-bearing medium of claim 8, wherein the character set is DBCS.
10. The signal-bearing medium of claim 7, wherein the second coded character set identifier specifies a character set, a code page, and an encoding scheme.
- 10 11. The signal-bearing medium of claim 10, wherein, wherein the encoding scheme is UTF-8.
12. A signal-bearing medium encoded with a data structure, wherein the data structure comprises:
- 15 a source field including a data type; and
an attribute for the data type, wherein a replication controller is to
determine whether data associated with the data type is blob,
determine a source coded character set identifier associated with the data
type, wherein the source coded character set identifier specifies a source character
20 set, a source code page, and a source encoding scheme, and
replicate the data to a target field based on the source coded character set
identifier and a target coded character set identifier.
13. The signal-bearing medium of claim 12, wherein the target field has an associated
25 type of character.
14. The signal-bearing medium of claim 12, wherein the source character set is DBCS.
15. The signal-bearing medium of claim 12 wherein the target coded character set
30 identifier specifies a target character set, a target code page, and a target encoding
scheme.

16. The signal-bearing medium of claim 15, wherein, wherein the target encoding scheme is UTF-8.

5 17. An electronic device comprising:

a processor; and

a storage device encoded with instructions that when executed on the processor
comprise:

10 determining that blob data in a source field is associated with a source
coded character set identifier, wherein the source coded character set identifier
specifies a source character set, a source code page, and a source encoding
scheme,

15 determining a target coded character set identifier for a target field,
wherein the target field has an associated type of character, and wherein the target
coded character set identifier specifies a target character set, a target code page,
and a target encoding scheme, and

20 replicating the blob data from the source field to the target field based on
the source coded character set identifier and the target coded character set
identifier.

18. The electronic device of claim 17, wherein the source character set is DBCS.

19. The electronic device of claim 17, wherein, wherein the encoding scheme is UTF-8.

25 20. The electronic device of claim 17, wherein the source field is in a source relational
database and the target field is in a target relational database.
